

Prevent Cyber attacks

1. Activate MFA

Multi-factor authentication validates your identity and requires your approval to access applications.

2. Update OS and software

Upgrade to the latest version of your software to benefit from the latest security features.

3. Use anti-malware

This will detect and remove virus and malware from your computer.

4. Never share your information

Do not disclose your personal information to unauthorized people

5. Delete suspicious emails

Cybercriminals introduce virus to your computer through email attachments. Do not click links from unknown senders.

6. Avoid unsecured WiFi

When you connect to a public network, it leaves you vulnerable to cyber attacks.
