Dementia

Dr. Laura Cummings
March 1, 2023
Plan

• Background
• Objectives
• PAL cases
• Go home!
UGME Clerkship Objectives

1. Conduct an interview to elicit a possible diagnosis of Alzheimer’s disease and screen for features of Lewy body dementia, vascular dementia, and frontotemporal dementia, and demonstrate an understanding of the importance of collateral sources of information

2. Demonstrate the ability to properly administer the Montreal Cognitive Assessment (MoCA) and Folstein exams, and explain the significance of deficits in any of the domains tested

3. Demonstrate an understanding of the unique stressors and demands placed on the family and caregivers of patients with dementia, and counsel them on sources of support and information
MCC Objectives

Given a patient with dementia”

1. List and interpret critical clinical findings including those based on
   a. A history from the patient and other collateral to determine whether cognitive decline has occurred, the time course, and possible risk factors (e.g. drugs, toxins)
   b. A differentiation of true neurocognitive disorder (dementia) from psychiatric disorders (e.g. depression)
   c. Determination of the patient’s mental status as well as the results of the mini-mental status examination

2. List and interpret critical investigations (e.g. TSH, B12, VRDL)

3. Conduct and effective initial management plan including
   a. Treatment of reversible underlying conditions
   b. Initiation of appropriate pharmacotherapy (e.g. cholinesterase inhibitors)
   c. Patient and family counseling (e.g. prognosis, alternate decision-making and support services)
   d. Determination as to whether a referral to specialized services (e.g. occupational therapy, addictions treatment) is required.
What is dementia?

• Decline in cognitive ability severe enough to **impact daily function**
• **Not normal aging**
• Encompasses multiple different diagnoses – most are **progressive**

- **569 600** Canadians are currently living with dementia
- **1 in 5** Canadians have cared for someone with dementia
- **$10.4 billion** is spent per year on dementia care in Canada
DSM-V Criteria: Major Neurocognitive Disorder

A. Evidence of significant cognitive decline from previous level of performance in **one or more cognitive domain(s)**

B. Interferes with independence in everyday activities (at least complex IADLs)

C. Not due exclusively to delirium

D. Not better explained by another psychiatric disorder (eg. depression)
Perceptual-motor function
- Visual perception
- Visuoconstructive reasoning
- Perceptual-motor coordination

Language
- Object naming
- Word finding
- Fluency
- Grammar and syntax
- Receptive language

Executive function
- Planning
- Decision-making
- Working memory
- Responding to feedback
- Inhibition
- Flexibility

Learning and memory
- Free recall
- Cued recall
- Recognition memory
- Semantic and autobiographical
- Long-term memory
- Implicit learning

Complex attention
- Sustained attention
- Divided attention
- Selective attention
- Processing speed

Social cognition
- Recognition of emotions
- Theory of mind
- Insight
ADLs and IADLs

### ADLs
- Eating
- Bathing
- Toileting
- Getting In and Out of Bed
- Getting Around Inside
- Getting Dressed

### IADLs
- Housework
- Grocery Shopping
- Money Management
- Making Meals
- Getting Around Outside
- Going Places Outside of Walking Distance
- Telephone Use
- Taking Medications
# ADLs and IADLs

<table>
<thead>
<tr>
<th>DEATH</th>

</tbody>
</table>
What is dementia?

Normal aging
- No objective cognitive loss
- Recalls with cueing

Mild Cognitive Impairment (MCI)
- Cognitive loss with NO functional impairment

Major Neurocognitive Disorder (dementia)
- Cognitive loss WITH functional impairment
What is dementia?

Dementia =
progressive cognitive impairment

WITH

functional impairment
Risk factors for dementia

- **Age**: greatest factor – 80% of cases > age 75
- **Trauma**: head injuries/TBI
- **Vascular risk factors**: HTN, DM, CVD, stroke/TIA history, smoking, dyslipidemia, OSA
- **Genetics**: genetic variants; Down’s syndrome
- **Drugs**: eg. anticholinergics, benzodiazepines, alcohol
- **Psychosocial**: low SES, social isolation, physical inactivity, depression
An approach to dementia

**History (and collateral)**
- Symptoms of dementia
- Differentiating between different types of dementia
- Consider the 3Ds
- Functional and safety assessment
- Collateral information

**Physical exam**
- Examination
  - MOCA
  - MMSE
  - Geriatric depression scale (GDS)
  - Confusion Assessment Method (CAM)

**Investigations**
- Rule out reversible causes

**Management**
- Pharmacologic management
- Non-pharmacologic management
- Family/caregiver support
Getting a good history

- How is your memory? Do you find yourself forgetful?
- Have other family members or friends told you that they are concerned about your memory?
- How do you spend your days?
- Do you feel a sense of enjoyment in life eg. hobbies?
- Are there things that you used to do that you don’t do anymore? Why did you stop?

Collateral information is critical
Triangulate with your own observations
Think about the “A”s of dementia

• Aphasia – problems with language and communication
• Agnosia – problems with recognizing things or people
• Apraxia – loss of motor skills needed for movement and coordination
• Amnesia – memory loss
• Altered perception – may present as paranoia, delusions
• Apathy – loss of interest in what is happening around them
• Anosognosia – inability for individual to recognize impairments
Remember: Dementia is not one disease

- Alzheimer’s disease
- Vascular neurocognitive impairment
- Lewy body disease/Parkinson’s
- Frontotemporal dementia
- Traumatic brain injury
- Huntington’s disease
- HIV
- Other causes
<table>
<thead>

</table>
Confusion Assessment Method (CAM)

1. Acute onset of mental status changes or a fluctuating course
   and
2. Inattention
   and
3. Disorganized thinking
   or
4. Altered level of consciousness
   = Delirium
Geriatric Depression Scale (GDS)

Choose the best answer for how you have felt over the past week:

1. Are you basically satisfied with your life? **YES** / **NO**
2. Have you dropped many of your activities and interests? **YES** / **NO**
3. Do you feel that your life is empty? **YES** / **NO**
4. Do you often get bored? **YES** / **NO**
5. Are you in good spirits most of the time? **YES** / **NO**
6. Are you afraid that something bad is going to happen to you? **YES** / **NO**
7. Do you feel happy most of the time? **YES** / **NO**
8. Do you often feel helpless? **YES** / **NO**
9. Do you prefer to stay at home, rather than going out and doing new things? **YES** / **NO**
10. Do you feel you have more problems with memory than most? **YES** / **NO**
11. Do you think it is wonderful to be alive now? **YES** / **NO**
12. Do you feel pretty worthless the way you are now? **YES** / **NO**
13. Do you feel full of energy? **YES** / **NO**
14. Do you feel that your situation is hopeless? **YES** / **NO**
15. Do you think that most people are better off than you are? **YES** / **NO**

Answers in **bold** indicate depression. Score 1 point for each bolded answer.

A score > 5 points is suggestive of depression.
A score ≥ 10 points is almost always indicative of depression.
A score > 5 points should warrant a follow-up comprehensive assessment.
Physical exam & in-office testing

Exam
• Vitals
• General physical exam
• Neurological exam
  • Focal deficits, upper motor findings
  • Parkinsonism

Psychometric testing:
• Mini-Cog: clock drawing, naming, 3-word recall
• Montreal Cognitive Assessment (MoCA)
• Mini Mental Status Examination (MMSE)

Screening tools for other contributing factors:
• Geriatric Depression Scale (GDS)
• Confusion Assessment Method (CAM)
MoCA

Normal: ≥26/30

Sensitivity: 100%
Specificity: 87%

~10 minutes to administer
MoCA

More info than just a total score

Example administration:
https://youtu.be/XjrnsIXoSCg

Administration and scoring tips with examples:
https://youtu.be/wO7n19KMveU

References: ACTonALZ.org, psychdb.com, mocatest.org
Clock drawing examples

1. Is there correct spacing with even spaces between numbers?
2. Is the placement of 3, 6, 9, and 12 correct?
3. Is the placement of the clock hands (hour and minute) correct?

NORMAL CLOCK DRAWING

STIMULUS BOUND RESPONSE

PERSEVERATION

HEMINEGLIGENCE
MMSE

Normal: ≥24/30

Sensitivity: 44-100%
Specificity: 46-100%

---

Mini-Mental State Examination (MMSE)

Instructions: Score one point for each correct response within each question or activity.

</tbody>
</table>
Investigations

Work up to assess for underlying causes

**Should generally do**
- CBC → rule out anemia
- Calcium → rule out hypercalcemia
- TSH → rule out hypothyroidism
- B12 → rule out B12 deficiency
- Glucose (FBG) → rule out hyperglycemia
- Electrolytes → rule out hyponatremia

**Might do**
- Folate (if malnutrition or celiac)
- ECG (rule out CI to AChEi: left BBB, heart block, sick sinus, HR < 50)

**Should generally not do**
- Homocysteine level
- CSF amyloid or tau level
- Genetic testing (ie. testing apoE*)

* although may consider testing for other genes in select cases with genetic counseling
Investigations

What about head imaging? *(CCCDTD3)*

CT/MRI generally recommended if ≥1 of the following are present:

- Age < 60 years old
- Rapid (eg. over 1-2 months) unexplained decline in cognition or function
- Short duration of dementia
- Recent and significant head trauma
- Unexplained neurologic symptoms (eg. new onset of severe headache or seizures)
- History of cancer (especially types that metastasize to the brain)
- Use of anticoagulants or history of bleeding disorder
- History of urinary and gait disorder early in course of dementia (consider NPH)
- Any new localizing signs (eg. hemiparesis or Babinski reflex)
- Unusual or atypical cognitive symptoms or presentation (eg. progressive aphasia)
- Significant vascular risk factors – to rule in vascular dementia
Management: Non-pharmacologic

Refer:
• Alzheimer’s Society, Dementia Society, SW, OT, home care CCAC

Reduce risk factors:
• Healthy diet, exercise; smoking, EtOH; socialization
• Vascular dementia: manage vascular risk factors (HTN, DM, smoking, lipids); consider antiplatelet if previous stroke Hx

Address medication & comorbid issues:
• Eliminate contributing meds (eg. BZD, anticholinergics)
• Blister pack medications/pill reminders
• Consider impact of dementia on ability to manage comorbidities (eg. DM, CHF)

Address safety issues:
• Driving
• Fire hazards (eg. microwave, stove, smoke detector)
• Wandering, falls (recommend Medic Alert)

Consider caregiver issues:
• Respite services, counseling, support groups, day programs, placement

Consider capacity issues & ACP*:
• SDM/POA status, GOC

*ideally with patient while patient is still capable; if not, will need to discuss with SDM/POA
Management: Pharmacologic

**Acetylcholinesterase inhibitors (AChEIs) – eg. donepezil**
- For mild to moderate AD
- “Rule of thirds”: super, stable, and non-responders
- SE: nausea, vomiting, diarrhea, hypotension, bradycardia (avoid with heart block)
- Contraindications: 2° or 3° heart block, LBBB, sick sinus, bradycardia, long QTc
- No evidence long term benefit

**N-methyl-D-aspartate receptor antagonist – memantine**
- For moderate to severe AD; monotherapy or with AChEI
- SE: dizziness, confusion, agitation, renal damage
- No evidence for long term benefit
1. Address underlying triggers → physical, emotional, environmental
2. Non-pharmacologic treatment → eg. behavioural therapy
3. Pharmacologic treatment (mostly antipsychotics) → if acute risk of harm to others; distressing/disturbing symptoms; non-pharm not effective
   • Discuss risks vs. benefits, obtain consent, start low and go slow, reassess regularly
Driving safety

Absolute contraindications to driving (CMA Driver’s Guide):

- Severe dementia
- Inability to perform $\geq 2$ IADLs or $\geq 1$ ADL due to cognition
- Dementia with LB with hallucinations and visual-spatial impairment
- Behavioural variant FTD

Figure 1. Checklist of considerations in driving safety

- History of driving accidents or near accidents*
- Family member concerns*
- Trail Making A and B tests—for processing speed, “task switching,” and visuospatial and executive function
- Clock-drawing test—for visuospatial and executive function
- Copying intersecting pentagons or cube—for visuospatial function
- Cognitive test scores—possibly helpful
- Dementia severity according to the Canadian Medical Association guidelines$^{26}$—inability to independently perform 2 instrumental activities of daily living or 1 basic activity of daily living

*Ask the patient and a family member separately.
<table>
<thead>
<tr>
<th>Time: ≤10 minutes. It is not necessary to complete all 10 items if the patient is obviously unsafe to drive based on ≥1 item.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>1. Dementia type</strong></td>
</tr>
<tr>
<td>Generally Lewy body dementia (fluctuations, hallucinations, visuospatial problems) and frontotemporal dementia (if associated behaviour or judgment issues) are unsafe.</td>
</tr>
<tr>
<td><strong>2. Functional impact of the dementia</strong></td>
</tr>
<tr>
<td>According to Canadian Medical Association guidelines, driving is unsafe if there is</td>
</tr>
<tr>
<td>• impairment of more than 1 instrumental ADL (IADL) due to cognition (SHAI: shopping, household/hobbies, accounting, food, telephone/tools);</td>
</tr>
<tr>
<td>• or impairment of 1 or more personal ADL (PADL) due to cognition (DEATH: dressing, eating, ambulation, transfers, hygiene).</td>
</tr>
<tr>
<td><strong>3. Family concerns</strong></td>
</tr>
<tr>
<td>(ask in a room separate from the person) Do you feel safe/unsafe in the car when the individual with dementia is driving? (Make sure family has recently been in the car with the person driving)</td>
</tr>
<tr>
<td>The granddaughter question: Would you feel it was safe if a 5-year-old granddaughter was in the car alone with the person driving? (Often produces a different response from family’s answer to previous question) Generally if the family feels the person is unsafe, he or she is unsafe. If the family feels the person is safe, the person may still be unsafe as the family may be unaware or may be protecting patient.</td>
</tr>
<tr>
<td><strong>4. Visuospatial</strong></td>
</tr>
<tr>
<td>(intersecting pentagons, clock drawing) If major abnormalities, likely unsafe</td>
</tr>
<tr>
<td><strong>5. Physical inability to operate a car</strong></td>
</tr>
<tr>
<td>(often a &quot;physical&quot; reason is better accepted) Medical/physical concerns such as musculoskeletal problems, weakness/multiple medical conditions (neck turn, problems in the use of steering wheel/pedals), cardiac/neurological (episodic &quot;spells&quot;)</td>
</tr>
<tr>
<td><strong>6. Vision/visual fields</strong></td>
</tr>
<tr>
<td>Significant problems including visual acuity, field of vision</td>
</tr>
<tr>
<td><strong>7. Drugs (if associated with side effects: drowsiness, slow reaction time, lack of focus)</strong></td>
</tr>
<tr>
<td>Alcohol, benzodiazepines, narcotics, neuroleptics, sedatives, anticholinergic, antiparkinsonian, muscle relaxants, tricyclics, antihistamines (OTC), antiemetics, antipiruritics, antipsamodics, and others</td>

ROAD MAP FOR ASSESSMENT OF A DRIVER WITH DEMENTIA

Unsafe to drive (page 19-20)

- The doctor will confirm the diagnosis of dementia and address any conditions that could be aggravating the situation
- The doctor will ask the person to stop driving (may provide a written record and document in medical record) (page 25)
- Provincial Registrar will be notified and will make the final decision about whether the license will be cancelled

Driving risk is uncertain (page 18)

- IF there are additional health and safety concerns requiring further assessment and treatment OR the person truly cannot afford an on-road test
- Referral to a local multidisciplinary dementia assessment site (could include occupational therapy or neuropsychology evaluation)

Appears safe (page 16-17)

- IF driving safety is the only issue to assess
- Referral for a health professional-led comprehensive on/off-road driving evaluation (page 12)

Follow-up with physician (every 6 – 12 months)

If still unsure about fitness to drive

Gold standard
Role of the family physician

• Help keep patients well, address modifiable risk factors
• Provide timely diagnosis
• Exclude other conditions that may present like dementia
• Communicate the diagnosis with dignity – and be there to follow-up
• Coordinate care - including community-based services
• Address caregiver burden
• Initiate goals of care discussions
• Assess and address for safety – including driving
• Manage ongoing comorbidities – “whole person care”

DSM-5 diagnostic criteria for dementia due to Alzheimer’s disease (AD)

A. Significant decline in one or more cognitive domains

B. Cognitive deficits interfere with independence in everyday activities (at minimum, assistance required for complex IADLs e.g. medications, finances)

C. Not exclusively in context of delirium

D. Not better explained by another mental disorder

E. Insidious onset and gradual progression of impairment in ≥2 cognitive domains

F. Either of the following:

   - Causative AD gene mutation from family history or genetic testing

   - All three of:
     1. Clear decline in memory and ≥1 other domain
     2. Steadily progressive gradual decline in cognition without extended plateaus
     3. No evidence of mixed etiology**

*Based on patient/informant concern, or clinician; and substantial impairment in cognitive performance preferably documented by standardized neuropsychological testing or another quantified assessment

**No other neurodegenerative or cerebrovascular disease, or another neurological, mental or systemic disease or condition contributing to cognitive decline
Summary of non-AD major neurocognitive disorders

Box 5: Key characteristics of non-Alzheimer disease dementias

Frontotemporal dementia
- Younger age of onset than Alzheimer disease
- Hallmark features typically include either:
  - Prominent behavioural changes (e.g., social conduct dysregulation, disinhibition, perseveration and emotional blunting) OR
  - Prominent language impairment (e.g., progressive nonfluent aphasia or semantic problems, with breakdown of word meaning and knowledge)

Dementia associated with Lewy bodies or with Parkinson disease
- Clinical features of these 2 conditions overlap considerably
- Dementia associated with Parkinson disease begins with idiopathic Parkinson disease for ≥ 1 year before the onset of dementia, whereas dementia associated with Lewy bodies begins with a cognitive and behavioural disorder that can have concurrent parkinsonian features
- Neuropsychiatric features include visual hallucinations and fluctuations in disease course

Vascular dementia
- Typically evolves in stepwise fashion but can also progress insidiously
- Hallmark cognitive feature of a dysexecutive syndrome
- Focal neurologic findings frequently found early in the disease course
Vascular dementia

• Imaging evidence of cerebrovascular disease (ie. microangiopathic changes, previous stroke)
• May have focal neurological findings early after onset
• Temporal relationship between vascular event and cognitive decline; often **step-wise progression**

Symptoms & disability accumulate over time

Stabilizes after each event

TIA/stroke
Dementia with Lewy Bodies or with Parkinson’s disease

- **T**remor: shaking, usually starting on one side
- **R**igidity: stiffness of the limbs, neck, or trunk
- **A**kinesia: loss or impairment in power of voluntary movement
- **P**osture and balance

- Stooped posture
- Masked facial expression
- Flexed elbows & wrists
- Forward tilt of trunk
- Reduced arm swinging
- Slightly flexed hips & knees
- Trembling of extremities
- Shuffling, short-stepped gait
Dementia with Lewy Bodies or with Parkinson’s Disease

• Fluctuating cognition **early in the course of disease**
• Recurrent vivid visual hallucinations (often animals)
• Associated features of parkinsonism (TRAP)
• May have concurrent REM sleep disorder
• **Neuroleptic hypersensitivity**
• Memory and object naming often less affected vs. Alzheimer’s

If parkinsonism features for ≥1 year before dementia → **PD**
If onset of dementia within one year of parkinsonism features → **LBD**
Frontotemporal Dementia (FTD)

**Behavioural variant**
- Young onset (50 to 60s) with *prominent personality changes* (lack of insight, social awareness, empathy; apathy)

**Language variant (primary progressive aphasia)**

*Semantic-variant:* *prominent problems with comprehension*
- Speech fluency normal
- May demonstrate anomia, semantic paraphasia, surface dyslexia and dysgraphia

*Non-fluent/agrammatic variant:* *prominent problems with fluency*
- Effortful, non-fluent, halting speech
- May demonstrate anomia, over-simplification of words
Normal Pressure Hydrocephalus (NPH)

“Weird, Wet, & Wobbly”

Weird → Rapidly progressive cognitive decline
Wet → Urinary urgency or incontinence
Wobbly → Gait apraxia
