Our January edition of the Connect.Excite.Heal. Series highlighted the Neurocognitive Testing Service (NCTS), a recent initiative of uOBMRI to support researchers looking to incorporate cognitive and mental health outcomes into their research. The rates of cognitive impairment and mental health challenges are high across multiple neurological and clinical populations, yet these outcomes are not always included in research studies. The NCTS addresses the lack of neuropsychological services devoted specifically to supporting research, in turn advancing uOBMRI’s capacity to lead cognitive and patient-reported outcomes research in Canada.
"We established the Neurocognitive Testing Service based on feedback from patients about what matters to them."

- LISA WALKER, PhD, C. Psych.
  Consulting Psychologist, Neurocognitive Testing Service
